

# No barcodes No mistakes No shrink

PicoCooler Vision integrates computer vision technology, controlled access, and seamless payments into a refrigerated point-of-sale unit, enabling unattended retail in public spaces.

With an intuitive customer experience and AI item recognition, it ensures 24/7 user grab and go convenience with zero-shrink for the operators.

## How it works

Once a customer unlocks the door with a payment method, four interior cameras begin tracking the interaction. Each item picked up (or put back) is logged using a hybrid edge/cloud AI system, which identifies products based on trained SKU profiles. When the door closes, the cart is finalized and the customer is charged - fast, secure, and accurate.

# PicoCooler Vision: Tech Overview (Cont.)

## Why it works

- **Zero shrink, full visibility:** Transactions are recorded and stored securely for 30 days, so you can investigate discrepancies with confidence
- **AI that learns with you:** New or unrecognized SKUs go through a manual review process to refine the model, so every restock gets smarter
- **No scanning. No guessing. No gaps:** Customers aren't charged unless the AI is confident. If it's unsure, the system flags the transaction for review

## Best practices for peak performance

- **Planograms in ADM:** Keep your cooler organized and optimized. ADM tells the system what's stocked, speeding up recognition and improving accuracy
- **Item images matter:** Images boost AI recognition and help drivers follow the planogram during restocks
- **Streamlined restocking with 365Ops:** Drivers can unlock the cooler, follow the planogram on their phone, and make last-minute edits in real-time

PicoCooler Vision brings secure, automated retail to public spaces, offering 24/7 access, effortless transactions, and peace of mind for operators.
