

V5 Email Domain

The V5 kiosk can display a standard email domain to make entering email addresses easier when creating or logging into an account or getting an emailed receipt. The V5 can support one standard domain and when in use, it will take the place of the current **.com** button on the various keyboards throughout the UI. To setup an email domain, follow the steps below.

1. On ADM, go to the **Location Summary** page.
2. In the **Domain** field, enter a domain, such as @gmail.com.

The screenshot shows a form with the following fields:

- Country: United States
- Timezone: Eastern Time
- Phone Number: (empty)
- Domain: @gmail.com (highlighted with a red border)
- User Key: (empty)

3. Select **Update Prices & Full Sync** on the **Location Summary** page.
4. The keyboard on the V5 will now display the email domain as shown below.
Note: The text size of the domain will shrink to fit into the pre-defined space of the button.
